## Training an RNN is straightforward

1. Determine gradient using backpropagation
    - Apply generalized backpropagation to the unrolled computational graph (algorithm repeated in next slide)
    - No specialized algorithms are necessary
  2. Gradient Descent
    - Gradients obtained by backpropagation are used with any general purpose gradient-based techniques to train an RNN
- Called BPTT: Back Propagation Through Time

# General Backpropagation to compute gradient

To compute gradients  $\mathbb{T}$  of variable  $z$  wrt variables in computational graph  $\mathcal{G}$

---

**Algorithm 6.5** The outermost skeleton of the back-propagation algorithm. This portion does simple setup and cleanup work. Most of the important work happens in the `build_grad` subroutine of algorithm 6.6

---

**Require:**  $\mathbb{T}$ , the target set of variables whose gradients must be computed.

**Require:**  $\mathcal{G}$ , the computational graph

**Require:**  $z$ , the variable to be differentiated

Let  $\mathcal{G}'$  be  $\mathcal{G}$  pruned to contain only nodes that are ancestors of  $z$  and descendants of nodes in  $\mathbb{T}$ .

Initialize `grad_table`, a data structure associating tensors to their gradients

`grad_table[z] ← 1`

**for**  $\mathbf{V}$  in  $\mathbb{T}$  **do**

`build_grad(V,  $\mathcal{G}$ ,  $\mathcal{G}'$ , grad_table)`

**end for**

Return `grad_table` restricted to  $\mathbb{T}$

---

# Build-grad function of Generalized Backprop

**Algorithm 6.6** The inner loop subroutine `build_grad(V, G, G', grad_table)` of the back-propagation algorithm, called by the back-propagation algorithm defined in algorithm 6.5.

**Require:**  $\mathbf{V}$ , the variable whose gradient should be added to  $\mathcal{G}$  and `grad_table`.

**Require:**  $\mathcal{G}$ , the graph to modify.

**Require:**  $\mathcal{G}'$ , the restriction of  $\mathcal{G}$  to nodes that participate in the gradient.

**Require:** `grad_table`, a data structure mapping nodes to their gradients

**if**  $\mathbf{V}$  is in `grad_table` **then**

    Return `grad_table[V]`

**end if**

$i \leftarrow 1$

**for**  $\mathbf{C}$  in `get_consumers(V, G')` **do**

$\text{op} \leftarrow \text{get\_operation}(\mathbf{C})$

$\mathbf{D} \leftarrow \text{build\_grad}(\mathbf{C}, \mathcal{G}, \mathcal{G}', \text{grad\_table})$

$\mathbf{G}^{(i)} \leftarrow \text{op.bprop}(\text{get\_inputs}(\mathbf{C}, \mathcal{G}'), \mathbf{V}, \mathbf{D})$

$i \leftarrow i + 1$

**end for**

$\mathbf{G} \leftarrow \sum_i \mathbf{G}^{(i)}$

`grad_table[V] = G`

Insert  $\mathbf{G}$  and the operations creating it into  $\mathcal{G}$

Return  $\mathbf{G}$

Ob. `bprop(inputs, X, G)`

returns  $\sum_i (\nabla_{\mathbf{x}} \text{op.f}(\text{inputs}))_i G_i$

Which is just an implementation of chain rule

If  $\mathbf{y} = g(x)$  and  $z = f(\mathbf{y})$  from chain rule  $\frac{dz}{dx} = \frac{dz}{dy} \frac{dy}{dx}$

$$\frac{\partial z}{\partial x_i} = \sum_j \frac{\partial z}{\partial y_j} \frac{\partial y_j}{\partial x_i}$$

$$\nabla_{\mathbf{x}} z = \left( \frac{\partial \mathbf{y}}{\partial \mathbf{x}} \right)^T \nabla_{\mathbf{y}} z$$

Equivalently, in vector notation where  $\frac{\partial \mathbf{y}}{\partial \mathbf{x}}$  is the  $n \times n$  Jacobian matrix of  $g$

## Example for how BPTT algorithm behaves

- BPTT: Back Propagation Through Time
- We provide an example of how to compute gradients by BPTT for the RNN equations

$$\begin{aligned} \mathbf{a}^{(t)} &= \mathbf{b} + \mathbf{W}\mathbf{h}^{(t-1)} + \mathbf{U}\mathbf{x}^{(t)} \\ \mathbf{h}^{(t)} &= \tanh(\mathbf{a}^{(t)}) \\ \mathbf{o}^{(t)} &= \mathbf{c} + \mathbf{V}\mathbf{h}^{(t)} \\ \hat{\mathbf{y}}^{(t)} &= \text{softmax}(\mathbf{o}^{(t)}) \end{aligned}$$

$$\begin{aligned} &L\left(\{\mathbf{x}^{(1)}, \dots, \mathbf{x}^{(\tau)}\}, \{\mathbf{y}^{(1)}, \dots, \mathbf{y}^{(\tau)}\}\right) \\ &= \sum_t L^{(t)} \\ &= - \sum_t \log p_{\text{model}}\left(y^{(t)} \mid \{\mathbf{x}^{(1)}, \dots, \mathbf{x}^{(t)}\}\right) \end{aligned}$$

## Intuition of how BPTT algorithm behaves

- Ex: Gradients by BPTT for RNN eqns given above

Nodes of our computational graph include the parameters  $U, V, W, b, c$  as well as the sequence of nodes indexed by  $t$  for  $\mathbf{x}^{(t)}, \mathbf{h}^{(t)}, \mathbf{o}^{(t)}$  and  $L^{(t)}$

For each node  $\mathbf{N}$  we need to compute the gradient  $\nabla_{\mathbf{N}} L$  recursively

# Computing BPTT gradients recursively

- Start recursion with nodes immediately preceding final loss

$$\frac{\partial L}{\partial L^{(t)}} = 1$$

- We assume that the outputs  $o^{(t)}$  are used as arguments to softmax to obtain vector  $\hat{y}$  of probabilities over the output. Also that loss is the negative log-likelihood of the true target  $y^{(t)}$  given the input so far.
- The gradient on the outputs at time step  $t$  is

$$(\nabla_{o^{(t)}} L)_i = \frac{\partial L}{\partial o_i^{(t)}} = \frac{\partial L}{\partial L^{(t)}} \frac{\partial L^{(t)}}{\partial o_i^{(t)}} = \hat{y}_i^{(t)} - \mathbf{1}_{i,y^{(t)}}$$

Work backwards starting from the end of the sequence.  
At the final time step  $\tau$ ,  $h^{(\tau)}$  has only  $o^{(\tau)}$  as a descendent. So

$$\nabla_{h^{(\tau)}} L = V^T \nabla_{o^{(\tau)}} L$$

## Gradients over hidden units

- Iterate backwards in time iterating to backpropagate gradients through time from  $t = \tau - 1$  down to  $t = 1$

$$\begin{aligned}\nabla_{\mathbf{h}^{(t)}} L &= \left( \frac{\partial \mathbf{h}^{(t+1)}}{\partial \mathbf{h}^{(t)}} \right)^\top (\nabla_{\mathbf{h}^{(t+1)}} L) + \left( \frac{\partial \mathbf{o}^{(t)}}{\partial \mathbf{h}^{(t)}} \right)^\top (\nabla_{\mathbf{o}^{(t)}} L) \\ &= \mathbf{W}^\top (\nabla_{\mathbf{h}^{(t+1)}} L) \text{diag} \left( 1 - (\mathbf{h}^{(t+1)})^2 \right) + \mathbf{V}^\top (\nabla_{\mathbf{o}^{(t)}} L)\end{aligned}$$

- where  $\text{diag} \left( 1 - (\mathbf{h}^{(t+1)})^2 \right)$  indicates a diagonal matrix with elements within parentheses. This is the Jacobian of the hyperbolic tangent associated with the hidden unit  $i$  at time  $t+1$

## Gradients over parameters

- Once gradients on internal nodes of the computational graph are obtained, we can obtain gradients on the parameters
  - Because parameters are shared across time steps some care is needed

$$\begin{aligned} \nabla_{\mathbf{c}} L &= \sum_t \left( \frac{\partial \mathbf{o}^{(t)}}{\partial \mathbf{c}} \right)^\top \nabla_{\mathbf{o}^{(t)}} L = \sum_t \nabla_{\mathbf{o}^{(t)}} L \\ \nabla_{\mathbf{b}} L &= \sum_t \left( \frac{\partial \mathbf{h}^{(t)}}{\partial \mathbf{b}^{(t)}} \right)^\top \nabla_{\mathbf{h}^{(t)}} L = \sum_t \text{diag} \left( 1 - \left( \mathbf{h}^{(t)} \right)^2 \right) \nabla_{\mathbf{h}^{(t)}} L \\ \nabla_{\mathbf{V}} L &= \sum_t \sum_i \left( \frac{\partial L}{\partial o_i^{(t)}} \right) \nabla_{\mathbf{V} o_i^{(t)}} = \sum_t (\nabla_{\mathbf{o}^{(t)}} L) \mathbf{h}^{(t)\top} \\ \nabla_{\mathbf{W}} L &= \sum_t \sum_i \left( \frac{\partial L}{\partial h_i^{(t)}} \right) \nabla_{\mathbf{W}^{(t)} h_i^{(t)}} \\ &= \sum_t \text{diag} \left( 1 - \left( \mathbf{h}^{(t)} \right)^2 \right) (\nabla_{\mathbf{h}^{(t)}} L) \mathbf{h}^{(t-1)\top} \\ \nabla_{\mathbf{U}} L &= \sum_t \sum_i \left( \frac{\partial L}{\partial h_i^{(t)}} \right) \nabla_{\mathbf{U}^{(t)} h_i^{(t)}} \\ &= \sum_t \text{diag} \left( 1 - \left( \mathbf{h}^{(t)} \right)^2 \right) (\nabla_{\mathbf{h}^{(t)}} L) \mathbf{x}^{(t)\top} \end{aligned}$$
