Multiple Time Scales

• One way to deal with long-term dependencies is to design a model that operates at multiple time scales
  • Some parts of the model operate at fine-grained time scales and can handle small details
  • Other parts operate at coarse time scales and transfer information from the distant past to the present more efficiently

• Strategies for building both fine and coarse time scales
  • Addition of skip connections across time
  • *Leaky units* that integrate signals with different time constants
  • Removal of some of the connections used to model fine-grained time scales
Adding skip connections through time

• One way to obtain coarse time scales is to add direct connections from variables in the distant past to variables in the present.
• In an ordinary RNN, recurrent connection goes from time $t$ to time $t+1$. Can construct RNNs with longer delays.
• Gradients can vanish/explode exponentially wrt no. of time steps.
• Introduce time delay of $d$ to mitigate this problem.
• Gradients diminish as a function of $\tau/d$ rather than $\tau$.
• Allows learning algorithm to capture longer dependencies.
  • Not all long-term dependencies can be captured this way.
Leaky units and a spectrum of time scales

• Rather than an integer skip of $d$ time steps, the effect can be obtained smoothly by adjusting a real-valued $\alpha$

• Running Average
  • Running average $\mu^{(t)}$ of some value $v^{(t)}$ is $\mu^{(t)} \leftarrow \alpha \mu^{(t-1)} + (1 - \alpha)v^{(t)}$
  • Called a linear self-correction
  • When $\alpha$ is close to 1, running average remembers information from the past for a long time and when it is close to 0, information is rapidly discarded.

• Hidden units with linear self connections behave similar to running average. They are called *leaky units*.

• Can obtain product of derivatives close to 1 by having *linear* self-connections and a weight near 1 on those connections
Removing Connections

• Another approach to handle long-term dependencies
• Organize state of the RNN at multiple time scales
  • Information flowing more easily through long distances at the slower time scales
• It involves actively removing length one connections and replacing them with longer connections
• Skip connections add edges
